De La Rue brings its extensive experience to configure the right solution from its world leading technology portfolio. With true global sales and service coverage; wherever our customers do business, De La Rue is there to provide value-added, proactive and flexible.

Cash Star™ 7125/7225

Multi-function cash recycling ATM

World experts in cash recycling

The Cash Star 7125/7225 is a fully-automated cash dispenser and deposit teller machine, designed to fulfil the requirement to automate routine self-banking operations. This ATM platform incorporates a cash-recycling module which enables cash deposits to be made outside of normal bank opening hours, with cash deposits being credited immediately to customers' accounts.

This ATM is designed to maximise deposit and recycling capacity whilst still being compliant with ergonomic guidelines, allowing the deposit of up to 12,000 notes or the recycling of 10,000 notes from up to 4 denominations.

Many other features, such as cheque deposit, safe bag deposit, passbook and A4 statement printing are also available in the same unit, making the Cash Star 7125/7225 a truly flexible self-service banking solution. All these features are available within an excellent footprint vs. functionality ratio.

This advanced recycling technology enables banks to offer both convenience and availability of their services to customers. As deposited banknotes are fed directly into the dispensing cassettes, ATM cash management can be carried out remotely, substantially increasing operational autonomy and reducing the need for cash replenishment.

The latest technological innovations and the highest manufacturing quality standards make Cash Star 7125/7225 a state-of-the-art multi-functional and fully automated teller machine.

Delivering advanced recycling technology for business benefit

European Banknote Recycling Framework compliant

The Cash Star 7125/7225 is fully compliant with the European Banknote Recycling Framework; it checks banknotes deposited into the machine for authenticity and fitness in accordance with the standards set by the ECB. Counterfeit banknotes are stored in a separate compartment.

Improves customer service and convenience

Routine banking operations are fully automated, freeing up tellers to concentrate on customers' needs and added-value activities. The possibility of access to banking operations outside of normal business hours is especially useful for merchants processing takings at the end-of-day.

Enhanced security

Incorporating the latest generation technology to address current security issues – 3DES, remote key loading, anti-skimming and anti-Lebanese loop features in the card reader – plus safes and locks graded from UL291 to CEN IV, the Cash Star 7125/7225 range has the built-in capability of validating banknotes that are dispensed or retracted. This feature not only increases security but also simplifies the cash management process for financial institutions.

Greater flexibility

A fully featured ATM, the Cash Star 7125/7225 offers flexibility in its configuration to suit most business requirements. This fully functional ATM is available in three different configurations;

- Interior through-the-wall (Cash Star 7225)
- Lobby stand alone front load (Cash Star 7125)
- Lobby stand alone rear load (Cash Star 7125)

The Cash Star 7125/7225 can also be used in three different formats: as a full cash recycler ATM, as a cash dispenser ATM providing intelligent deposit, or purely as a deposit system. Changing between these three formats is simply a matter of a software update, allowing the machine's functionality to change as your business requirements change.

Both the Cash Star 7125 and 7225 are available with a safe bag deposit option, which allows the deposit of coins, cheques and other items of value while offering a backup fault tolerant solution for cash deposits. Alternatively, the Cash Star 7125/7225 can incorporate a cheque scanner that enables the validation of cheques upon deposit and their secure storage. This option uses the latest generation cheque handling technology, including doubles detection and foreign object identification.
